Motivation for the Intern Ship 100%

Confidence to pass the Intern Ship 80%

Plan Plan to do today

Finish the catalog, including WhatIs and ReleaseNotes.

For WhatIs: aims at providing an uniform platform to trace hotels running data, as well as automatically doing computational tasks to generate reports in the form of table or graph, to improve staffs working efficiency.

1. Think about more user roles, such as HR management, accountant pay for salary.
2. Think about some utilities, such as currency exchange for payment.
3. Think deeper about the software, neither under-design nor over-design. (PDCA cycle)

For ReleaseNote: Think more about function benefits rather than algorithm implelement

1. Whether our functions satisfy daily working and actually used in hotels? (Functions are really needed?)
2. What benefit does our functions bring to users? (Functions can do what? If there isn't our software, what users should do to achieve related task? Such as "do xxx rather than do xxx")
3. What is the advantage does our functions have? (Compare with other software? Easier to use?)

Others:

Draw some graphs to demonstrate different users' relationship in our software.

Do Work you did today

Update ReleaseNote:

1. Add new functions for HR and accountant.

For HR: staff check-in, staff check-out, staff manage

For accountant: make payroll

2. Think the benefit deeper and describe functions more detail.

Check and update "How to use" and "User benefit" for every function.

3. Re-evaluate the priority for each function:

The often used functions will get high priority and will be developed first.

In this way, the basic functions will get high priority, and the functions rely on on them will get lower priority.

Therefore, the killer feature may get low priority but it doesn't mean that these functions are not important.
